

Intelligence Tests

Intelligence tests involve a single test or test battery to assess a person's cognitive performance. Because populations experience IQ gains over time, IQ tests must be constantly re-standardized so that subjects are not scored against inaccurate norms. Using obsolete IQ norms can cause problems especially when comparing scores between different groups and populations. Examples include:

- The Stanford-Binet Intelligence Scale, Form L-M (SBL-M)
- The Wechsler Intelligence Scale for Children-IV (WISC-IV)
- The Wechsler Intelligence Scale for Adults – III (WAIS-III)
- The Wechsler Abbreviated Scale of Intelligence™ (WASI™)
- Kaufman Brief Intelligence Test (K-BIT)
- Kaufman Adolescent & Adult Intelligence Test (KAIT)
